

EzeScan Advanced Scanning Integration with infoXpert

Version Date: March 2009

The EzeScan advanced document imaging solution has been integrated with **infoXpert** providing customers with advanced scanning features including Zonal OCR and Forms processing and saving the documents **directly** into **infoXpert** from within EzeScan.

The functionality provided by the EzeScan Pro KFI, Discovery and eDRMS Modules combines high speed Document Scanning with Intelligent Keyword searching to find information based on different form layouts. It provides increased productivity when using documents such as Supplier Invoices and Application Forms, so that field information like Name, Address, Invoice Number, Invoice Date, Amount, Application Details, etc. can be extracted and populated into infoXpert fields with these values.

The time saving feature provided by the integration EzeScan and infoXpert is that the document is registered directly into infoXpert without having to save the scanned document and upload into infoXpert as a separate process.

EzeScan Document Scanning

EzeScan has been providing advanced document scanning solutions to document management clients since 2002. By utilising API's, EzeScan enables images to be integrated seamlessly into infoXpert easily and effectively, with no scripting needed.

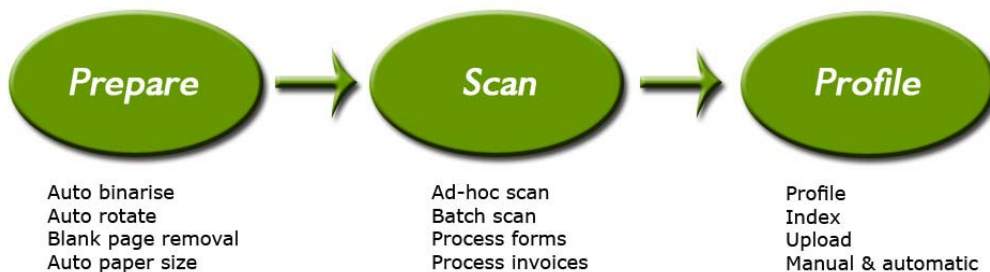

This means an easy "out of the box solution" can be used with any Twain device (i.e. MFD copier or dedicated scanner) to provide an effective way to batch scan forms, documents and invoices, and tackle those hard scanning issues that come across your desk every day.

EzeScan can also provide a combination of solutions that suits your needs:

- in a personalised workstation solution, - single scanner and desktop
- in a community solution (Kiosk & MFD for multi use)
- in an Enterprise "Server" solution, a number of input devices are monitored for upload of images and metadata to various output systems including infoXpert.

The EzeScan solution begins with the base PRO module (which now also includes built in OCR & Text Searchable PDF support). It can then be extended through the addition of optional AUDIT, BCR, DISCOVERY, EDRMS, ICR, KFI, PUBLISH, ROUTING, and UPLOAD modules.

EzeScan reduces bottlenecks for users

How does the infoXpert integration with EzeScan Work?

As EzeScan has a modular design there are 3 possible integration methods with the infoXpert system.

EzeScan PRO

Use EzeScan PRO to scan 1 or more documents and place the output files into a local document queue where they can be imported into infoXpert using the infoXpert import tool. EzeScan can also OCR, rotate images, PDF and delete blank pages automatically.

EzeScan PRO +EDRMS

Use EzeScan PRO to scan one or more documents and profile each document directly into infoXpert from EzeScan.

Document registration is initiated from within EzeScan itself using the EzeScan EDRMS infoXpert registration form.

This provides a quick method of profiling batches of unstructured or structured documents into infoXpert.

EzeScan DM Bundle

The EzeScan DM Bundle combines the previous options 1 and 2 with the additional flexibility of being able to scan and profile documents, forms & invoices directly into infoXpert from EzeScan, bypassing the need to use the standard infoXpert registration form.

The KFI module indexing process replaces the infoXpert registration form. The UPLOAD module can upload each document into infoXpert automatically without displaying a registration form.

With this configuration you can type in a field value, choose a lookup list value, or capture field values from documents using the inbuilt OCR module, or optional BCR or ICR modules, then populate the infoXpert index fields. You also have the choice to reuse fields automatically, or auto populate, thereby saving considerable time not having to reselect the same values.

This option provides the fastest method for profiling batches of documents into infoXpert. Buy the modules you need today, safe in the knowledge that you can purchase an upgrade for other modules, like Barcoding or ICR, at a later time.

EzeScan also supports advanced infoXpert features including:

- Assign Document to infoXpert Workflow
- Document Retention settings
- Redacted versions for FOI requests including forms redaction and mark up histories

EzeScan solutions range from basic manual entry to highly automated forms processing, all without a per-page scan charge. With over 450 EDRMS installations in Australia, Canada and the UK, EzeScan is the ideal batch scanning application for infoXpert users looking for advanced forms processing and scanning features.

About Outback Imaging

Outback Imaging, based out of Australia and the United Kingdom, is a software research and development company, specialising in document capture. Outback Imaging products enable clients to substantially slash the cost of deploying document processing solutions for unstructured, semi structured and structured (forms based) hardcopy documents. The flagship document scanning product suite is marketed under the brand name EzeScan.

EzeScan Evaluation

An evaluation copy of EzeScan can be made available upon request. If you would like to see a product demonstration please contact Outback Imaging to arrange a suitable time and venue, or for more information on Outback Imaging's Document Capture Solutions contact Outback Imaging:
